The ACM LIMITS workshops (to date: 2015, 2016, 2017) aim to foster discussion on the impact of present and future ecological, material, energetic, and societal limits on computing. These topics are seldom discussed in contemporary computing research.

A key aim of the workshop is to promote innovative, concrete research, potentially of an interdisciplinary nature, that focuses on technologies, critiques, techniques, and contexts for computing within fundamental economic and ecological limits.

A longer-term goal is to build a community around relevant topics and research. We hope to impact society through the

design and development of computing systems in the abundant present for use in a future of limits.
